import google.generativeai as genai
You: What is Python? In 20 words
Bot: Python is a versatile, high-level programming language known for its readability and extensive libraries.
You: Explain machine learning in short
Bot: Machine learning enables computers to learn from data and make predictions or decisions without explicit programming.
You: My name is Mehul.
Bot: Nice to meet you, Mehul! How can I help you today?
You: What is my name?
Bot: Your name is Mehul.

import google.generativeai as genai
You: Hello
Bot: Hello! How can I help you today?
You: My name is Mehul
Bot: Nice to meet you, Mehul! How can I assist you today? Is there anything specific you'd like to talk about, or a question you have?
You: What is AI?
Bot: That's a great question, Mehul!

**AI stands for Artificial Intelligence.**

In its simplest terms, AI is a broad field of computer science that focuses on **creating machines that can perform tasks that typically require human intelligence.**

Essentially, it's about making computers "smart" enough to learn, reason, solve problems, understand language, recognize patterns, and make decisions, often without explicit human programming for every single scenario.

Here's a breakdown of what that generally involves:

1. **Learning:** AI systems are trained on vast amounts of data to identify patterns and make predictions. This is where **Machine Learning (ML)** comes in – it's a core subset of AI. Instead of being explicitly programmed for every possible outcome, they learn from examples.
2. **Reasoning:** AI can process information, draw conclusions, and make decisions based on logical rules or learned patterns.
3. **Problem-Solving:** It can find solutions to complex problems, often by trying various approaches or using heuristics.
4. **Perception:** AI can interpret sensory information, like understanding images (Computer Vision) or spoken language (Natural Language Processing).
5. **Language Understanding:** AI can process, understand, and even generate human language, which is crucial for chatbots, voice assistants, and translation tools.

**Two Main Types of AI:**

* **Narrow AI (or Weak AI):** This is most of the AI we see today. It's designed to perform a **specific task** very well.
  * **Examples:** Siri or Alexa (voice assistants), recommendation engines (Netflix, Amazon), spam filters, self-driving cars (within their specific domains), medical diagnostic tools.
* **General AI (or Strong AI / AGI):** This is AI that can understand, learn, and apply intelligence across a wide range of tasks, just like a human. This type of AI is still largely theoretical and is a subject of much research and science fiction.

**In summary:** AI is about giving machines the ability to think and act in ways that mimic or even surpass human intelligence, enabling them to solve problems and automate tasks that were once exclusively within the human domain.
